

IN THE CLAIMS

Please amend claims 1-4, 8, 10, 12-26, 30, 32, and 34-44 as indicated below.

1. (Currently Amended) A method comprising:

receiving a new policy tree at a network element in a network, wherein the network element stores a current policy tree of classes for quality of service (QoS) of packets being processed by the network element, and wherein the classes of the current policy tree and the classes of the new policy tree include leaf classes and non-leaf classes;

comparing the classes of the current policy tree with the classes of the new policy tree, including

for the current policy tree and the new policy tree, merging, into a set of classification rules of the leaf classes, classification rules of non-leaf classes that are parents of the leaf classes,

identifying a leaf class in the current policy tree as identical to a leaf class in the new policy tree upon determining that the set of classification rules of the leaf class in the current policy tree is equal to the set of classification rules of the leaf class in the new policy tree,

identifying a non-leaf class in the current policy tree as identical to a non-leaf class in the new policy tree upon determining that the non-leaf class in the current policy tree and the non-leaf class in the new policy tree share a greatest number of equivalent descendant leaf classes, and

marking the classes of the current policy tree and the new policy tree as added, deleted, modified or unchanged based on the identifying of

the identical leaf and non-leaf classes in the current policy tree and
new policy tree; and

selectively deleting classes of the current policy tree based on the comparison of
the classes.

2. (Currently Amended) The method of claim 1, wherein the QoS of packets includes
a set of parameters which describe required traffic characteristics of a data connection of
the packets, including a minimum bandwidth, a maximum delay, a maximum loss and
jitter of the data connection, wherein each of packets includes a packet header having a
type of service field to store a value indicating a level of the QoS required for the
respective packet, and wherein the level of the QoS is used to identify a class of policy for
processing the respective packet by the network element-classes of the current policy tree
and the classes of the new policy tree comprise leaf classes and non-leaf classes.

3. (Currently Amended) The method of claim 2, wherein each class includes a class
name, a type of service, and an amount of bandwidth associated with the respective class,
wherein the leaf classes do not have a child class and are orthogonal to a remainder of the
leaf classes, and wherein each non-leaf class as a parent class includes at least one leaf
class as a child class and each leaf class includes a set of rules that are constrained by a
parent class associated with the respective leaf class.

~~wherein the comparing of the classes of the current policy tree with the classes of the new
policy tree comprises:~~

~~for the current policy tree and the new policy tree, merging, into a set of
classification rules of the leaf classes, classification rules of non-leaf
classes that are ancestors of the leaf classes;~~

~~identifying a leaf class in the current policy tree as identical to a leaf class in the new policy tree upon determining that the set of classification rules of the leaf class in the current policy tree is equal to the set of classification rules of the leaf class in the new policy tree;~~

~~identifying a non leaf class in the current policy tree as identical to a non leaf class in the new policy tree upon determining that the non leaf class in the current policy tree and the non leaf class in the new policy tree share a greatest number of equivalent descendant leaf classes; and~~

~~marking the classes of the current policy tree and the new policy tree as added, deleted, modified or unchanged based on the identifying of the identical leaf and non leaf classes in the current policy tree and new policy tree.~~

4. (Currently Amended) The method of claim 3, wherein the selectively deleting classes of the current policy tree comprises deleting a class of the current policy tree upon determining that a set of classification rules of the class of the current policy tree is different than a set of classification rules of a corresponding class of the ~~second~~ new policy tree.

5. (Original) The method of claim 4, wherein each class in the current and new policy tree is positioned at a level in the current and new policy tree and wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that that the leaf class of the current policy tree is not positioned at a same level as a leaf class of the new policy tree.

6. (Original) The method of claim 3, wherein the selectively deleting classes of the current policy tree comprises selectively deleting at least one leaf class of the current policy tree.
7. (Original) The method of claim 3, wherein the selectively deleting classes of the current policy tree comprises selectively deleting at least one non-leaf class of the current policy tree.
8. (Currently Amended) The method of claim 3, wherein a class having a parent class further includes all classification rules included in the parent class, wherein a leaf class as a child of the parent class includes a set of its own rules and attributes and inherits all rule and attributes of its parent class except a root of the respective policy tree, the root representing a data link associated with an output port of the network element, and wherein the rules and attributes of a child class further limit the rules and attributes of its parent.
9. (Original) The method of claim 3, wherein each class is positioned at a level in a policy tree and wherein a leaf class of the current policy tree is identical to a leaf class of the new policy tree only if the leaf class of the current policy tree and the leaf class of the new policy tree are positioned at an equal level.
10. (Currently Amended) The method of claim 39, wherein each leaf class in the current policy tree and the new policy tree is reciprocally linked to an associated path of non-leaf classes in the current policy tree and new policy tree, respectively, and wherein the selectively deleting the classes of the current policy tree comprises deleting each leaf class in the current policy tree upon determining that the associated path of non-leaf

classes in the current policy tree is different from the path of non-leaf classes in the new policy tree for a leaf class.

11. (Original) The method of claim 3, wherein each class in the current and new policy tree is positioned at a level in the current and new policy tree, wherein each leaf class in the current policy tree and the new policy tree is reciprocally linked to an associated path of non-leaf classes in the current policy tree and new policy tree, respectively, and wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that the associated path of non-leaf classes linked to the leaf class of the current policy tree includes a non-leaf class positioned at a different level than a corresponding non-leaf class included in the associated path of non-leaf classes linked to the leaf class of the new policy tree.

12. (Currently Amended) The method of claim 11, wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that all ancestors of the leaf class of the current policy tree and corresponding ancestors of the leaf of the new policy tree have fewer identical descendant classes than those had by a class of the current policy tree and a class of the new policy tree positioned at the same level as the ~~ancestors-parents~~ of the leaf class of the current policy tree and the ancestors of the leaf class of the new policy tree.

13. (Currently Amended) The method of claim 8, wherein each of the classes having at least two children classes is identified as a scheduling class and each of the classes not having a child class is identified as a flow class, wherein packets of each flow class are processed in an order of the packets stored in a queue and packets of each scheduling class are processed according to a predetermined schedule, and wherein at least one of the

children classes of a scheduling class contains one or more flows that match the respective scheduling class and are not contained in a remainder of the children classes associated with the respective scheduling class.

A method comprising:

comparing a first policy tree of nodes with a second policy tree of nodes, wherein each node is reciprocally associated with a class of network packets, each class including a set of rules; and
selectively adding classes of the second policy tree to the first policy tree based on the comparison of the classes.

14. (Currently Amended) The method of claim 13, further comprising:

verifying each class of the new policy tree with respect to remaining classes of the new policy tree to avoid conflicts when the new policy is merged into a merged policy tree;
associating the merged policy tree with a termination point to activate the merged policy tree on the termination point; and
processing data packets using a packet processing pipeline according to the merged policy tree.

wherein the selectively adding classes of the second policy tree to the first policy tree comprises adding a node of the second policy tree to the first policy tree upon determining that the set of rules associated with the node of the first policy tree is different that the set of rules associated with the corresponding node of the second policy tree.

15. (Currently Amended) The method of claim 14, wherein the packet processing pipeline comprises:

an incoming packet manager (IPM) to examine a packet header of data packets to
determine a next hope of the data packets;
a class identifier (CI) coupled to the IPM to classify the data packets using the
merged policy tree;
a route identifier (RI) coupled to the CI to determine which output port through
which each of the data packets should be routed;
an outgoing packet manager (OPM) coupled to the RI to store the data packets for
outgoing purposes;
a flow identifier (FI) coupled to the OPM to identify one or more flows of which
the data packets belong; and
a traffic manager (TM) coupled to the FI to schedule the data packets out of the
output port using a result of the FI and the merged policy tree.

~~each node in the first and second policy tree is positioned at a level in the first and second~~
~~policy tree and wherein the selectively adding classes of the second policy tree to the first~~
~~policy tree comprises or adding a leaf node of the second policy tree to the first policy tree~~
~~upon determining that that the leaf node of the first policy tree is not positioned at a same~~
~~level as a leaf node of the second policy tree.~~

16. (Currently Amended) The method of claim 15, wherein the network element
includes an Ethernet interface card (EIC) coupled to a local area network (LAN) and an
ATM interface card (AIC) coupled to a wide area network (WAN), and wherein
processing data packets using a packet processing pipeline further comprises:
in response to a data packet received at the EIC from the LAN, a CI of the EIC
classifying the data packet using identification of the policy tree;
an RI of the EIC determining an output port through which the data packet should
be routed using information of the policy tree;

a FI of the AIC determining a flow to which the data packet belongs, using the policy tree; and
transmitting the data packet to the WAN through the output port according to QoS based on the policy tree.

~~13. wherein the selectively adding classes of the second policy tree to the first policy tree comprises selectively adding a leaf node of the second policy tree to the first policy tree.~~

17. (Currently Amended) The method of claim 16, wherein the network element further comprises a controller card, wherein the controller card is to perform following operations:

compiling each policy tree and generate a class lookup table (CLT) accessible by a

CI of the EIC;

associating each policy tree with a termination point and generate a routing table

accessible by each RI for looking up a next hop based on a class ID; and

creating a list of flow identifier and scheduling update commands to incrementally

change the flow tables for FIs and traffic manager tables for TMs using

flow class and scheduling class property information of the policy tree.

~~13. wherein the selectively adding classes of the second policy tree to the first policy tree comprises selectively adding a non leaf node of the second policy tree to the first policy tree.~~

18. (Currently Amended) The method of claim 17, wherein associating the policy tree with a termination point comprises:

creating tables required by the CI and IFM;

differentiating between classes that are currently in service from classes that will

be put into services to generate a list of FI and TM update commands;

distributing and synchronizing deleted classes by applying the tables and delete commands;

distributing and synchronizing added classes by applying the tables and add commands; and

distributing and synchronizing modified classes by applying the tables and modify commands.

~~13, wherein a class associated with a node having a parent node further includes all rules included in a class associated with the parent node.~~

19. (Currently Amended) The method of claim 18, wherein each class identifies a subset of packets using one or more classification rules, each classification rule including one or more rule terms, and each rule term including an identity of a data item and a set of constant values associated with the data item, wherein the set of constant values includes at least one of individual values, ranges of constant values, IP subnets expressed in a notation of A.B.C.D/E where A.B.C.D is an IP address and /E indicates a number of leading bits that identify the subnet portion of the IP addresses.

~~13, wherein each node is positioned at a level in the first and second policy tree of nodes and wherein a first leaf class is identical to a second leaf class only if a leaf node associated with the first leaf class and a leaf node associated with the second leaf class are positioned at an equal level.~~

20. (Currently Amended) The method of claim 19, wherein the data item is one of a source IP address, destination IP address, TCP/UDP source port, TCP/UDP destination port, ingress port of the network element, a type of service byte, a protocol type, and TCP acknowledgement flag.

~~13, wherein each leaf node in the first policy tree of nodes and the second policy tree of nodes is reciprocally linked to an associated path of non-leaf nodes in the first policy tree of nodes and second policy tree of nodes, respectively, and wherein the selectively adding classes of the second policy tree to the first policy tree comprises adding each leaf node in the second policy tree of nodes to the first policy tree of nodes upon determining that the associated path of non-leaf nodes in the first policy tree of nodes is different from the path of non-leaf nodes in the second policy tree of nodes for a leaf node.~~

21. (Currently Amended) The method of claim 20, wherein when a data packet is received at the network element, classification rules are evaluated to classify the data packet, wherein if the value of the data item matches any of the constant values associated with a rule term, the rule term is satisfied, wherein if all rule terms of a classification rule are satisfied, the classification rule is satisfied, and wherein the classification rule is satisfied, the data packet is considered to belong to a class associated with the satisfied classification rule.

~~13, wherein each node is positioned at a level in the first and second policy tree of nodes, wherein each leaf node in the first policy tree of nodes and the second policy tree of nodes is reciprocally linked to an associated path of non-leaf nodes in the first policy tree of nodes and second policy tree of nodes, respectively, and wherein the selectively adding the nodes of the second policy tree to the first policy tree comprises replacing a leaf node in the first policy tree of nodes with a corresponding leaf node in the second policy tree of nodes upon determining that the associated path of non-leaf nodes linked to the leaf node of the first policy tree includes a non-leaf node positioned at a different level than a corresponding non-leaf node included in the associated path of non-leaf nodes linked to the leaf node of the second policy tree.~~

22. (Currently Amended) The method of claim 18, wherein each class comprises one or more classification rules, QoS requirements, and a classification mask to specify which dimensions are specified in terms of the one or more classification rules, where the classification mask comprises:

- bit 0 to indicate a source IP address;
- bit 1 to indicate a destination IP address;
- bit 2 to indicate a source TCP/UDP port;
- bit 3 to indicate a destination TCP/UDP port;
- bit 4 to indicate an incoming port;
- bit 5 to indicate a type of service byte;
- bit 6 to indicate a type of protocol used; and
- bit 7 to indicate a TCP ACK flag.

~~21, wherein the selectively adding the nodes of the second policy tree to the first policy tree comprises adding a leaf node in the second policy tree of nodes to the first policy tree of nodes upon determining that all ancestors of the leaf node of the first policy tree and corresponding ancestors of the leaf node of the second policy tree have fewer identical descendant nodes than those had by a node of the first policy tree and a node of the new policy tree positioned at the same level as the ancestors of the leaf node of the first policy tree and the ancestors of the leaf node of the second policy tree.~~

23. (Currently Amended) A machine-readable medium that provides instructions, which when executed by a machine, cause said machine to perform operations comprising:

receiving a new policy tree at a network element in a network, wherein the network element stores a current policy tree of classes for quality of service (QoS) of packets being processed by the network element, and wherein the classes

of the current policy tree and the classes of the new policy tree include leaf classes and non-leaf classes;

comparing the classes of the current policy tree with the classes of the new policy tree, including

for the current policy tree and the new policy tree, merging, into a set of classification rules of the leaf classes, classification rules of non-leaf classes that are parents of the leaf classes,

identifying a leaf class in the current policy tree as identical to a leaf class in the new policy tree upon determining that the set of classification rules of the leaf class in the current policy tree is equal to the set of classification rules of the leaf class in the new policy tree,

identifying a non-leaf class in the current policy tree as identical to a non-leaf class in the new policy tree upon determining that the non-leaf class in the current policy tree and the non-leaf class in the new policy tree share a greatest number of equivalent descendant leaf classes, and

marking the classes of the current policy tree and the new policy tree as added, deleted, modified or unchanged based on the identifying of the identical leaf and non-leaf classes in the current policy tree and new policy tree; and
selectively deleting classes of the current policy tree based on the comparison of the classes.

24. (Currently Amended) The machine-readable medium of claim 23, wherein the QoS of packets includes a set of parameters which describe required traffic characteristics of a data connection of the packets, including a minimum bandwidth, a maximum delay, a maximum loss and jitter of the data connection, wherein each of packets includes a packet

header having a type of service field to store a value indicating a level of the QoS required for the respective packet, and wherein the level of the QoS is used to identify a class of policy for processing the respective packet by the network element~~classes of the current policy tree and the classes of the new policy tree comprise leaf classes and non-leaf classes.~~

25. (Currently Amended) The machine-readable medium of claim 24, wherein each class includes a class name, a type of service, and an amount of bandwidth associated with the respective class, wherein the leaf classes do not have a child class and are orthogonal to a remainder of the leaf classes, and wherein each non-leaf class as a parent class includes at least one leaf class as a child class and each leaf class includes a set of rules that are constrained by a parent class associated with the respective leaf class.
~~wherein the comparing of the classes of the current policy tree with the classes of the new policy tree comprises:~~

~~for the current policy tree and the new policy tree, merging, into a set of~~

~~classification rules of the leaf classes, classification rules of non-leaf classes that are ancestors of the leaf classes;~~

~~identifying a leaf class in the current policy tree as identical to a leaf class in the new policy tree upon determining that the set of classification rules of the leaf class in the current policy tree is equal to the set of classification rules of the leaf class in the new policy tree;~~

~~identifying a non-leaf class in the current policy tree as identical to a non-leaf class in the new policy tree upon determining that the non-leaf class in the current policy tree and the non-leaf class in the new policy tree share a greatest number of equivalent descendant leaf classes; and~~

~~marking the classes of the current policy tree and the new policy tree as added,
deleted, modified or unchanged based on the identifying of the identical
leaf and non-leaf classes in the current policy tree and new policy tree.~~

26. (Currently Amended) The machine-readable medium of claim 25, wherein the selectively deleting classes of the current policy tree comprises deleting a class of the current policy tree upon determining that a set of classification rules of the class of the current policy tree is different than a set of classification rules of a corresponding class of the ~~second~~ new policy tree.

27. (Original) The machine-readable medium of claim 26 wherein each class in the current and new policy tree is positioned at a level in the current and new policy tree and wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that that the leaf class of the current policy tree is not positioned at a same level as a leaf class of the new policy tree.

28. (Original) The machine-readable medium of claim 25, wherein the selectively deleting classes of the current policy tree comprises selectively deleting at least one leaf class of the current policy tree .

29. (Original) The machine-readable medium of claim 25, wherein the selectively deleting classes of the current policy tree comprises selectively deleting at least one non-leaf class of the current policy tree .

30. (Currently Amended) The machine-readable medium of claim 25, wherein a class having a parent class further includes all classification rules included in the parent class,

wherein a leaf class as a child of the parent class includes a set of its own rules and attributes and inherits all rule and attributes of its parent class except a root of the respective policy tree, the root representing a data link associated with an output port of the network element, and wherein the rules and attributes of a child class further limit the rules and attributes of its parent.

31. (Original) The machine-readable medium of claim 25, wherein each class is positioned at a level in a policy tree and wherein a leaf class of the current policy tree is identical to a leaf class of the new policy tree only if the leaf class of the current policy tree and the leaf class of the new policy tree are positioned at an equal level.

32. (Currently Amended) The machine-readable medium of claim ~~25~~31, wherein each leaf class in the current policy tree and the new policy tree is reciprocally linked to an associated path of non-leaf classes in the current policy tree and new policy tree, respectively, and wherein the selectively deleting the classes of the current policy tree comprises deleting each leaf class in the current policy tree upon determining that the associated path of non-leaf classes in the current policy tree is different from the path of non-leaf classes in the new policy tree for a leaf class.

33. (Original) The machine-readable medium of claim 25, wherein each class in the current and new policy tree is positioned at a level in the current and new policy tree, wherein each leaf class in the current policy tree and the new policy tree is reciprocally linked to an associated path of non-leaf classes in the current policy tree and new policy tree, respectively, and wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that the associated path of non-leaf classes linked to the leaf class of the current policy tree

includes a non-leaf class positioned at a different level than a corresponding non-leaf class included in the associated path of non-leaf classes linked to the leaf class of the new policy tree.

34. (Currently Amended) The machine-readable medium of claim 33, wherein the selectively deleting classes of the current policy tree comprises deleting a leaf class of the current policy tree upon determining that all ancestors-parents of the leaf class of the current policy tree and corresponding parents-ancestors of the leaf of the new policy tree have fewer identical descendant classes than those had by a class of the current policy tree and a class of the new policy tree positioned at the same level as the parents-ancestors of the leaf class of the current policy tree and the parents-ancestors of the leaf class of the new policy tree.

35. (~~Original~~Currently Amended) The method of claim 30, wherein each of the classes having at least two children classes is identified as a scheduling class and each of the classes not having a child class is identified as a flow class, wherein packets of each flow class are processed in an order of the packets stored in a queue and packets of each scheduling class are processed according to a predetermined schedule, and wherein at least one of the children classes of a scheduling class contains one or more flows that match the respective scheduling class and are not contained in a remainder of the children classes associated with the respective scheduling class.

~~A machine-readable medium that provides instructions, which when executed by a machine, cause said machine to perform operations comprising:~~

~~comparing a first policy tree of nodes with a second policy tree of nodes, wherein each node is reciprocally associated with a class of network packets, each class including a set of rules; and~~

~~selectively adding classes of the second policy tree to the first policy tree based on the comparison of the classes.~~

36. (Currently Amended) The machine-readable medium of claim 35, further comprising:

verifying each class of the new policy tree with respect to remaining classes of the new policy tree to avoid conflicts when the new policy is merged into a merged policy tree;

associating the merged policy tree with a termination point to activate the merged policy tree on the termination point; and

processing data packets using a packet processing pipeline according to the merged policy tree.

~~wherein the selectively adding classes of the second policy tree to the first policy tree comprises adding a node of the second policy tree to the first policy tree upon determining that the set of rules associated with the node of the first policy tree is different that the set of rules associated with the corresponding node of the second policy tree.~~

37. (Currently Amended) The machine-readable medium of claim 36, wherein the packet processing pipeline comprises:

an incoming packet manager (IPM) to examine a packet header of data packets to determine a next hop of the data packets;

a class identifier (CI) coupled to the IPM to classify the data packets using the merged policy tree;

a route identifier (RI) coupled to the CI to determine which output port through which each of the data packets should be routed;

an outgoing packet manager (OPM) coupled to the RI to store the data packets for outgoing purposes;

a flow identifier (FI) coupled to the OPM to identify one or more flows of which the data packets belong; and

a traffic manager (TM) coupled to the FI to schedule the data packets out of the output port using a result of the FI and the merged policy tree.

~~each node in the first and second policy tree is positioned at a level in the first and second policy tree and wherein the selectively adding classes of the second policy tree to the first policy tree comprises or adding a leaf node of the second policy tree to the first policy tree upon determining that that the leaf node of the first policy tree is not positioned at a same level as a leaf node of the second policy tree.~~

38. (Currently Amended) The machine-readable medium of claim 37, wherein the network element includes an Ethernet interface card (EIC) coupled to a local area network (LAN) and an ATM interface card (AIC) coupled to a wide area network (WAN), and wherein processing data packets using a packet processing pipeline further comprises:

in response to a data packet received at the EIC from the LAN, a CI of the EIC

classifying the data packet using identification of the policy tree;

an RI of the EIC determining an output port through which the data packet should be routed using information of the policy tree;

a FI of the AIC determining a flow to which the data packet belongs, using the policy tree; and

transmitting the data packet to the WAN through the output port according to QoS based on the policy tree.

~~35, wherein the selectively adding classes of the second policy tree to the first policy tree comprises selectively adding a leaf node of the second policy tree to the first policy tree.~~

39. (Currently Amended) The machine-readable medium of claim 38, wherein the network element further comprises a controller card, wherein the controller card is to perform following operations:

compiling each policy tree and generate a class lookup table (CLT) accessible by a

CI of the EIC;

associating each policy tree with a termination point and generate a routing table

accessible by each RI for looking up a next hop based on a class ID; and

creating a list of flow identifier and scheduling update commands to incrementally

change the flow tables for FIs and traffic manager tables for TMs using

flow class and scheduling class property information of the policy tree.

~~35, wherein the selectively adding classes of the second policy tree to the first policy tree comprises selectively adding a non leaf node of the second policy tree to the first policy tree.~~

40. (~~Original~~Currently Amended) The machine-readable medium of claim 39, wherein associating the policy tree with a termination point comprises:

creating tables required by the CI and LPM;

differentiating between classes that are currently in service from classes that will

be put into services to generate a list of FI and TM update commands;

distributing and synchronizing deleted classes by applying the tables and delete

commands;

distributing and synchronizing added classes by applying the tables and add

commands; and

distributing and synchronizing modified classes by applying the tables and modify

commands.

~~35, wherein a class associated with a node having a parent node further includes all rules included in a class associated with the parent node.~~

41. (Currently Amended) The machine-readable medium of claim 40, wherein each class identifies a subset of packets using one or more classification rules, each classification rule including one or more rule terms, and each rule term including an identity of a data item and a set of constant values associated with the data item, wherein the set of constant values includes at least one of individual values, ranges of constant values, IP subnets expressed in a notation of A.B.C.D/E where A.B.C.D is an IP address and /E indicates a number of leading bits that identify the subnet portion of the IP addresses.

~~35, wherein each node is positioned at a level in the first and second policy tree of nodes and wherein a first leaf class is identical to a second leaf class only if a leaf node associated with the first leaf class and a leaf node associated with the second leaf class are positioned at an equal level.~~

42. (Currently Amended) The machine-readable medium of claim 41, wherein the data item is one of a source IP address, destination IP address, TCP/UDP source port, TCP/UDP destination port, ingress port of the network element, a type of service byte, a protocol type, and TCP acknowledgement flag.

~~35, wherein each leaf node in the first policy tree of nodes and the second policy tree of nodes is reciprocally linked to an associated path of non-leaf nodes in the first policy tree of nodes and second policy tree of nodes, respectively, and wherein the selectively adding classes of the second policy tree to the first policy tree comprises adding each leaf node in the second policy tree of nodes to the first policy tree of nodes upon determining that the~~

~~associated path of non-leaf nodes in the first policy tree of nodes is different from the path of non-leaf nodes in the second policy tree of nodes for a leaf node.~~

43. (Currently Amended) The machine-readable medium of claim 42, wherein when a data packet is received at the network element, classification rules are evaluated to classify the data packet, wherein if the value of the data item matches any of the constant values associated with a rule term, the rule term is satisfied, wherein if all rule terms of a classification rule are satisfied, the classification rule is satisfied, and wherein the classification rule is satisfied, the data packet is considered to belong to a class associated with the satisfied classification rule.

~~35, wherein each node is positioned at a level in the first and second policy tree of nodes, wherein each leaf node in the first policy tree of nodes and the second policy tree of nodes is reciprocally linked to an associated path of non-leaf nodes in the first policy tree of nodes and second policy tree of nodes, respectively, and wherein the selectively adding the nodes of the second policy tree to the first policy tree comprises replacing a leaf node in the first policy tree of nodes with a corresponding leaf node in the second policy tree of nodes upon determining that the associated path of non-leaf nodes linked to the leaf node of the first policy tree includes a non-leaf node positioned at a different level than a corresponding non-leaf node included in the associated path of non-leaf nodes linked to the leaf node of the second policy tree.~~

44. (Currently Amended) A network element, comprising:

a processor; and

a memory coupled to the processor for storing instructions, when executed from

the memory, cause the processor to perform operations including

receiving a new policy tree at a network element in a network, wherein the
network element stores a current policy tree of classes for quality of
service (QoS) of packets being processed by the network element,
and wherein the classes of the current policy tree and the classes of
the new policy tree include leaf classes and non-leaf classes,
comparing the classes of the current policy tree with the classes of the new
policy tree, including
for the current policy tree and the new policy tree, merging, into a
set of classification rules of the leaf classes, classification
rules of non-leaf classes that are parents of the leaf classes,
identifying a leaf class in the current policy tree as identical to a leaf
class in the new policy tree upon determining that the set of
classification rules of the leaf class in the current policy tree
is equal to the set of classification rules of the leaf class in
the new policy tree,
identifying a non-leaf class in the current policy tree as identical to
a non-leaf class in the new policy tree upon determining that
the non-leaf class in the current policy tree and the non-leaf
class in the new policy tree share a greatest number of
equivalent descendant leaf classes, and
marking the classes of the current policy tree and the new policy
tree as added, deleted, modified or unchanged based on the
identifying of the identical leaf and non-leaf classes in the
current policy tree and new policy tree, and
selectively deleting classes of the current policy tree based on the
comparison of the classes.

~~The machine-readable medium of claim 43, wherein the selectively adding the nodes of the second policy tree to the first policy tree comprises adding a leaf node in the second policy tree of nodes to the first policy tree of nodes upon determining that all ancestors of the leaf node of the first policy tree and corresponding ancestors of the leaf node of the second policy tree have fewer identical descendant nodes than those had by a node of the first policy tree and a node of the new policy tree positioned at the same level as the ancestors of the leaf node of the first policy tree and the ancestors of the leaf node of the second policy tree.~~
